

NASRA Issue Brief: State and Local Government Contributions to Statewide Pension Plans: FY 16

June 2018

Pension benefits for employees of state and local governments are paid from trust funds to which public employees and their employers contribute during employees' working years. Timely contributions are vital to adequate funding and the sustainability of these plans: failing to pay required contributions results in higher future costs, due to foregone principal and investment earnings that the contributions would have generated.

Nationally, contributions made by state and local governments to pension trust funds in recent years account for just less than five percent of all spending.¹ Overall, the experience for FY 16 reflects a continuation of an improved effort among state and local governments to make actuarially determined pension contributions: on a dollar-weighted basis, the percentage of required contributions that was paid by public employers increased for the fourth consecutive year, while the rate of growth in pension costs continued to decline. Pension spending levels, however, vary widely among states and are actuarially sufficient for some pension plans and insufficient for others. Unlike employees, who must always contribute the amount prescribed in statute or by plan rules, a broad range of funding statutes, rules, policies, and practices is used to determine the contributions public employers—states, cities, etc.—make to public pension plans. This disparity in contribution governance arrangements is one of several factors contributing to a wide range of experience among public employers concerning required contributions.

This brief describes how contributions are determined; the recent public employer contribution experience; and trends in employer contributions over time.

The Retirement Benefit Plan Equation

A basic formula describes the financing of any type of retirement benefit:

$$C + I = B + E$$

Contributions plus investment earnings equals benefits plus expenses. The money that is drawn from a retirement plan, for benefits and administrative costs, ultimately must equal the money that is contributed to the plan and the investment earnings those contributions generate. This fundamental formula illustrates the vital role contributions play in funding a pension plan.

Actuarially Determined Contributions

Funding a pension plan takes place over many years and, as described in the box to the left, typically involves a combination of contributions from employees and employers, which are invested to generate investment earnings. Contributions are a vital source of public pension funding: of the \$7.0 trillion in public pension revenue since 1987, nearly 40 percent has come from contributions paid by employers and employees². The amount of contributions needed to fund a pension plan is calculated as part of an actuarial valuation, which is a mathematical process that determines a pension plan's condition and cost required to pay promised benefits.³

For public pension plans, an actuarially determined contribution, or ADC, typically is consistent with the annual required contribution, or

¹ NASRA, "State and Local Government Spending on Public Employee Retirement Systems," March 2018; calculation does not include spending from federal sources

² Contributions @ NASRA.org <http://www.nasra.org/contributions>

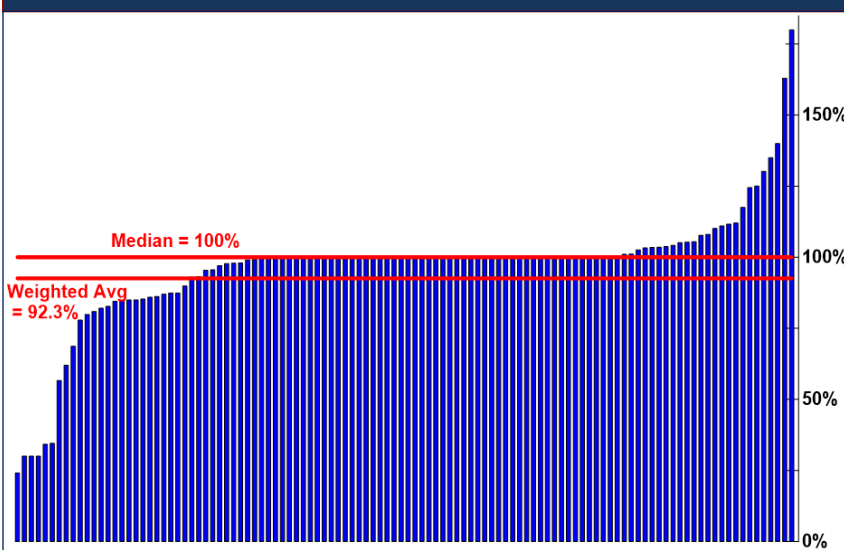

³ Professional actuaries are guided by Actuarial Standards of Practice; ASOP No. 4 provides guidance on the determination of the required cost, or contribution requirement, of a pension plan. ASOP #4 defines the Actuarially Determined Contribution as: "A potential payment to the plan as determined by the actuary using a contribution allocation procedure. It may or may not be the amount actually paid by the plan sponsor or other contributing entity." ASOP #4 defines Contribution Allocation Procedure as: "A procedure that uses an actuarial cost method, and may include an asset valuation method, an amortization method, and an output smoothing method, to determine the actuarially determined contribution for a plan. The procedure may produce a single value, such as normal cost plus an amortization payment of the unfunded actuarial accrued liability, or a range of values"

ARC, a concept introduced by GASB Statement 25 and defined essentially as the sum of the normal cost (the estimated cost of benefits earned each year); and an amortization payment. Amortization, or payment over time, is required when either or both a) contributions are insufficient, or b) the plan’s demographic or investment experience, or both, cause the value of assets and liabilities to diverge. Amortization is intended to eliminate this difference, which is known as the unfunded actuarial liability.

A broad range of funding mechanisms, including statutorily-fixed rates, actuarially-determined rates, and annual appropriations is used to fund public pension plans. Virtually all plans calculate an ADC, which serves as a benchmark to measure the sufficiency of the employer’s contribution. Pension plans typically maintain a funding policy by which they expect to reach full funding at the end of a specified period of time if the plan receives all of its actuarially determined contributions; and if all of the plan’s actuarial assumptions—about the many factors affecting the plan, such as future investment performance, how long plan participants will work, etc.—materialize as expected. Experience rarely matches assumptions, so pension plans regularly monitor, typically through annual or biannual actuarial valuations and periodic actuarial experience studies, the plan’s condition, and make needed adjustments to actuarial assumptions and required contribution rates to reflect the changes in experience.

Because actuarial methods, assumptions and benefit levels differ from one plan to another, the ADC also will vary. As a result, the ADC for two hypothetical plans with identical financial and demographic compositions could (and usually will) also differ. Also, laws and rules governing pension contributions vary widely among states and cities, and those provisions can affect public pension plan funding. For more information concerning the impact of funding policies, statutes and rules, see [“The Annual Required Contribution Experience of Statewide Pension Plans, FY 01 to FY 13.”](#)⁴

FY 2016 Contribution Experience

As shown in Figure 1, the median actuarially determined contribution received in FY 16 was 100 percent, and ranged from 24 percent to 180 percent. On a dollar-weighted basis, (as shown in Figure 2) the average ADC received was 92.3 percent, up from 91.3 percent in FY 15 and marking the fourth consecutive year of improvement and the second consecutive year in which annual contribution effort is above 90 percent.⁵ The FY 16 non-weighted average was 96.5 percent.

The aggregate rate of increase in required contributions from FY 15 to FY 16 was 2.3 percent, which is the lowest rate of increase during the measurement period and marks the third consecutive year of declining growth in required contributions. This reduced rate of increase also continues a trend seen in recent

years of slower annual growth in required contributions, especially compared to the sharp increases experienced in FY 03-05, following the market decline of 2000-2002. The slower growth in recent years has occurred at a time when many public pension plans have reduced their investment return assumption⁶, which, other factors being equal, increases required costs. Had return assumptions not been reduced, the increase would have been even lower. The slower rate of

⁴ NASRA, The Annual Required Contribution Experience of Statewide Pension Plans, FY 01 to FY 13

⁵ New GASB reporting requirements have resulted in some plans no longer reporting their ADC experience. GASB Statements 25 and 27 established a requirement that public pension plans present in their financial report a) a history of the calculated annual required contribution, and b) the employer contributions that were actually paid. Unlike Statement 25, Statement 67 does not require agent plans to report this information. Specifically, “the [GASB] board concluded that aggregated information about contributions to agent pension plans has limited decision utility because the pattern of contributions to each individual agent employer’s pension plan would be obscured if the aggregated amounts were reported about the agent plan as a whole.” Statement 67 also requires that, for cost-sharing plans, the plan’s ADC experience be reported only if an ADC is actually calculated.

⁶ NASRA Issue Brief, Public Pension Plan Investment Return Assumptions, February 2018

increase is caused partly by pension reforms, including higher required employee contributions and lower benefit levels (and costs) enacted in every state since 2009.⁷

Another factor contributing to higher pension costs in recent years is a movement among public pension plans toward more conservative methods to amortize unfunded actuarial liabilities. Research indicates that more plans are employing methods to pay off their unfunded liabilities more aggressively, which increases costs in the near-term, and reduces long-term costs.

Recent History of Employer Contributions

Spending on pensions by states & local government is just below five percent of all spending.⁸ The employer contribution experience since FY 2001 covers an eventful period, including two economic recessions—impairing state and local fiscal conditions—and two periods of sharp declines in capital markets, which increased unfunded pension liabilities. For the statewide plans measured for this study, actuarially determined contributions rose from \$27.8 billion in FY 01 to \$105.1 billion in FY 16, an increase of 179 percent in inflation-adjusted dollars. Actual contributions paid by employers during this period grew from \$28.0 billion to \$96.9 billion, an increase of 156 percent in inflation-adjusted dollars.

Figure 2 plots the weighted percentage of actuarially determined contributions received from FY 01 to FY 16. Because each state is unique in terms of its governance structure, pension funding policy and practice, the relative cost of its pension plan(s), fiscal condition, and other factors, so is the required contribution experience of each state also unique, and ranges widely. As Figure 3 shows, on a weighted average basis, states’ percentage of ARC/ADC paid since FY 2001 ranges from 40 percent to more than 100 percent. In the median, state plans received 98.0 percent of

their required contributions, and 86 percent as a weighted average. The average actuarially determined contribution received for the period was 92 percent, as a few larger plans pulled down the average because they received a relatively lower portion of their ADC.

Conclusion

Although contributions to public pensions remain on average a small percentage of state and local government spending, they also have grown in recent years. Depending on the plan, the growth of required employer contributions is due to one or more factors, including investment market losses, insufficient contributions, revisions to actuarial methods and assumptions, and demographic and investment experience that differs from assumptions. The overall experience for FY 16 reflects an improving effort among state and local government employers to make the full actuarially determined contribution, which will forestall higher costs in the future and strengthen the long-term sustainability of public pension plans.
